

Key Reasons To Use A Periodic Maintenance Program For Your Advance Dock Lift

Safety is a Priority

A poorly maintained lift can become a safety hazard and a liability to your business. If your lift breaks down or causes injury, your business suffers. Let a factory certified technician, who knows your lift better than anyone in the industry, make certain that your investment operates efficiently and safely for years to come.

Factory Certified Service Personnel

Factory certified Advance Lifts technicians know your equipment inside and out. They are some of the best trained technicians in the country with the correct tools and knowledge to ensure your lift is maintained properly.

Comprehensive Inspection

The Advance Lifts periodic maintenance program has a 25-point system check list that is one of the industries most inclusive programs. The system check list identifies and inspects all the critical elements of your equipment. Small problems will not be overlooked thus making sure big problems are less likely to occur.

Replacement Parts Availability

Factory certified representatives have access to every part and accessory your equipment could ever need and the Advance factory is known for its quick response when providing replacement parts.

Documentation of Work Performed

Upon completion of every inspection a detailed report is generated noting that all items have been checked and notes any items that require further inspection or replacement at a later date. This report becomes a maintenance log that allows any factory certified technician to pick up right where the last mechanic left off saving both time and money.

Satisfaction Guarantee

If, for any reason, you are not completely satisfied with the work performed your factory certified technician will return at no cost to make things right.
